Field of application

To avoid unacceptable forces and moments in pipe systems, the thermal expansion of the piping must not be restricted.

Constant hangers types 11-14, Constant supports type 16

Minor thermal displacement in the pipe systems in the vertical direction can be compensated by spring supports or spring hangers. Due to the resulting proportionally increasing force deviation corresponding to the spring rate, their use is limited to a displacement range specified by the designer (see Product Group 2, pp. 2.5 and 2.6).

In the case of greater vertical displacement the use of constant hangers or constant supports is required. For these special designs, the spring force is transformed into a constant force throughout the displacement range (see function principle, p. 1.5).

The proportional loads of the pipe system can in this way be constantly distributed over the whole displacement range without significant deviations. As a rule, for LISEGА constant hangers the use of type 11, tried and tested over 100,000 times, provides the standard solution.

Constant hanger
type 11

The function principle is based on the arrangement of three springs resulting in the parallelogram of forces. The design is distinguished by highly functional accuracy along with wide load adjustment ranges. The favorable power-to-weight ratios and symmetrical designs enable easy installation. For further typical advantages, see p. 1.3.

Constant hanger in a coal-fired power station

Final assembly of a constant hanger

Installation inspection of a constant hanger

Constant hanger type 18

As a rule, the pipe support engineer allows for sufficient installation space for the supports required. However, due to limitations of space the installation height can be too small for the typical standard solution with type 11.

This sometimes occurs, especially when replacing existing installations. To provide the optimum solution in such cases, type 18, a low profile design, is available from the LISEGA hanger range, beside the main type 11 series.

The function principle of this design is based on the lever principle. Unlike the usual lever-arm type hangers, the load displacement here is linear and is constant, following the LISEGA principle (see function principle, p. 1.6).

In the case of constant hangers, the pipe systems are suspended from roof constructions or the steelwork. If the piping is laid out near ground level it may be appropriate to take up the loads from below with constant supports.

Constant support type 19

Due to its compact design, constant support type 19 thereby replaces its predecessor, type 16, as standard. Type 16 continues to be standard only in the heavy-duty range (load range 100 – 400kN) for its coupling capacity.

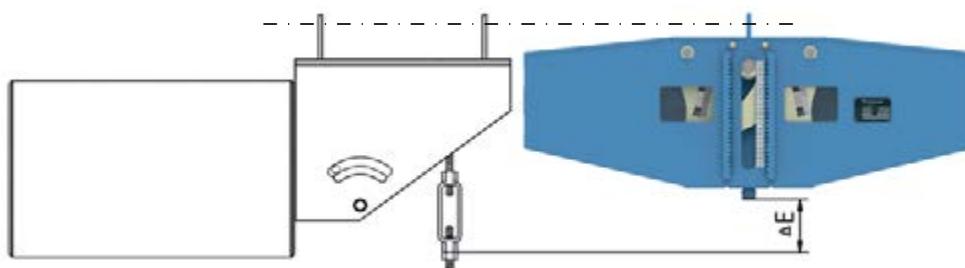

Constant hanger type 18

On the basis of their special function principles and modes of design, LISEGA constant hangers and supports have, for the past five decades, proven their outstanding operational safety and reliability many thousands of times. Further descriptions of their mode of operation and function are set out on p. 1.6 and their design features from p. 1.7.

For the operational safety and long life of the pipe systems and hence of the plant itself, the consistent functional accuracy of the constant hangers is of utmost importance.

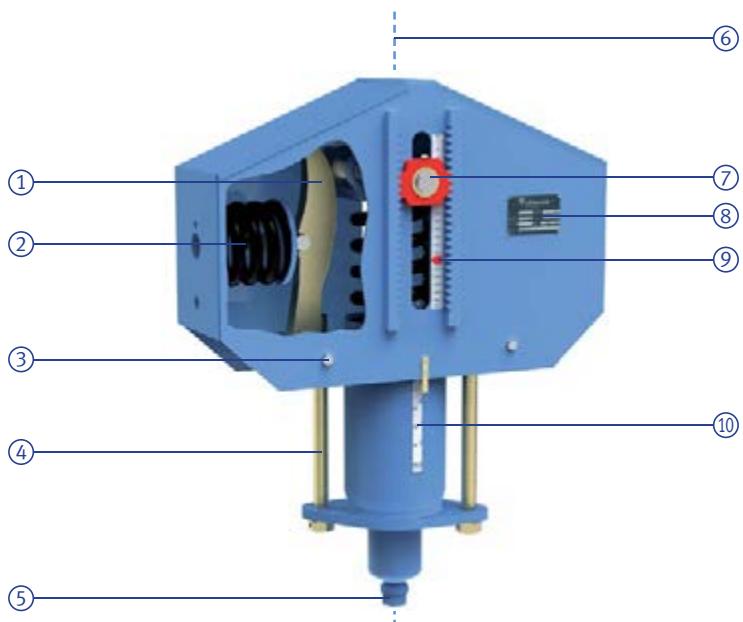

Constant support type 19

Space-saving design of type 18 compared to a conventional lever-arm hanger

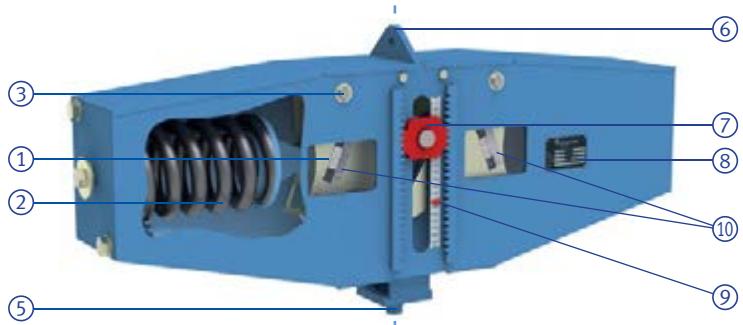

In comparison with conventional lever-arm type hangers the new LISEGA type 18 is lower profile and enables the creation of support chains in the smallest of spaces.

Special benefits of LISEGA constant hangers and supports

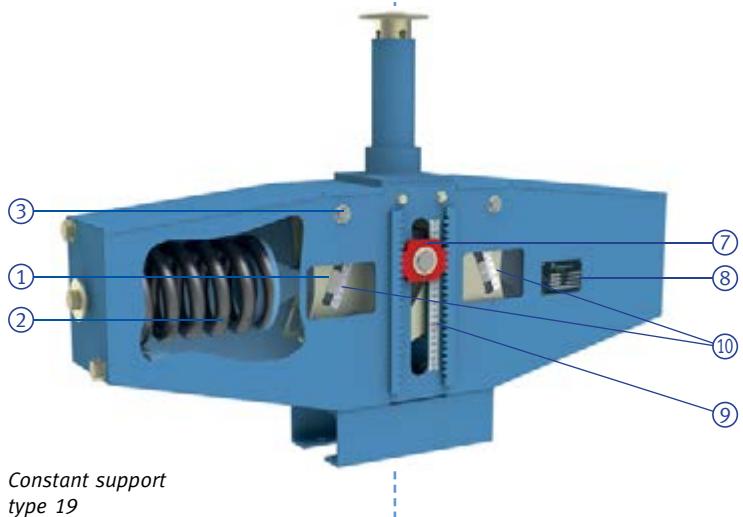

Constant hanger
type 11

axis of symmetry

Constant hanger
type 18

Constant support
type 19

The user can profit from a variety of special benefits where LISEGA constant hangers are concerned.

Significant savings are possible, especially regarding labor-intensive ancillary support costs such as planning, installation and operation.

- ① Principle-based constancy by way of a special function principle.
- ② Pre-relaxed springs eliminate any significant loss of load-bearing capacity.
- ③ Reduced friction due to minimized number of bearing points.
- ④ Especially wide load adjustment range avoids hanger replacement when operational loads change.
- ⑤ Turnbuckle function allows greater adjustment of pipe installation position.
- ⑥ Load application free of moments due to a single suspension point.
- ⑦ Blocking is adjustable to practically any travel position through fine-tooth notching.
- ⑧ Name plate contains complete technical specifications.
- ⑨ Directly readable travel scale with marking for hot/cold load positions.
- ⑩ Load scale with permanent marking of adjustment load.
- ✓ Symmetrical design ensures direct flow of forces through axis of symmetry.
- ✓ Favorable power-weight ratios for reduced installation loads.
- ✓ Arranged by load groups and travel ranges to simplify selection (modular system).
- ✓ Consistent functional behavior due to high-quality corrosion protection and maintenance-free chemically nickelized finishes.
- ✓ Readily adaptable to installation situation via corresponding designs and standardized accessories.
- ✓ Double load-tube guiding of constant supports for transmission of side loads.
- ✓ Secure connection of load chains due to load- and connection-compatible modular components.

LISEGA constant hanger and support types

As fixed elements in the pipe system concept, the pipe supports must operate smoothly as functional connections between the pipe system and the surrounding structure.

Type 11

Type 11 with support brackets

Type 18

Type 19

Type 17 with support brackets

Pipe systems are usually very complex layouts with restricted space. To allow for optimum use of the different spatial conditions, various designs are available as standard for the different application situations. All components are available either from stock or at short notice.

Constant hanger type 11 C3 19 to 11 96 15

Standard design for use as suspension for loads up to load group 9 (100kN) and travel range 6 (750mm). Travel range 7 (900mm) is available on request. If no space restrictions or other specifications are to be considered, this is the preferred product.

Constant hanger type 11 with support brackets type 71 C3 .1 to 71 97 .4

Standard design with support brackets bolted at the LISEGA factory for use as seated versions.

Constant hanger type 18 D3 17 to 18 93 17

Serial standard design in special low profile version as alternative suspension instead of type 11, if the installation height is limited.

Constant support type 19 D3 17 to 19 93 17

Serial standard design for use as support if constant support from below is required.

Note: This version replaces the taller single-cell constant hanger type 16 (see Standard Supports Catalog 2010) and is especially suitable in restricted spaces. Type 16 can still be supplied if required.

Heavy constant support type 16

Special design as multi-cell constant support type 16, if heavy loads have to be distributed.

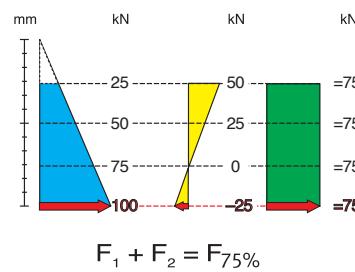

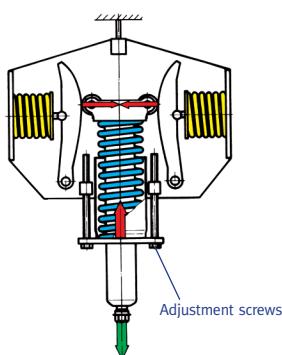

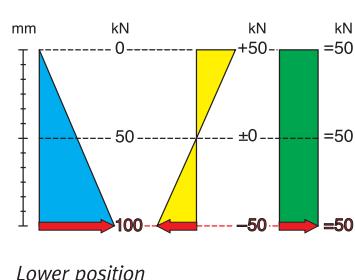

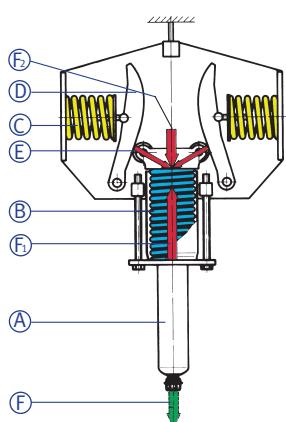

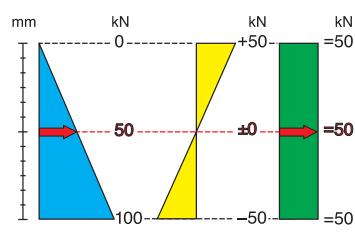

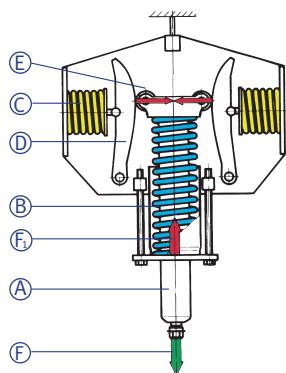

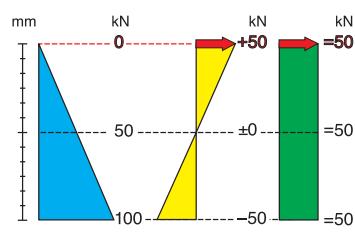

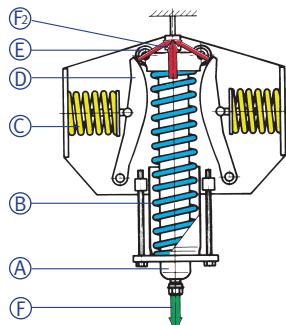

Servohanger type 17 52 15 to 17 93 15

Servohangers are equipped with additional active load regulation and can reduce overloading in the piping system to a permissible harmless level.

Type 16

Mode of operation and function

Types 11, 12, 13, 14, 16, 79

The LISEGA Function Principle

The LISEGA Function Principle is based on the interaction of the force from a mainspring and the resulting force of two connected balance springs. The force directions of the pre-loaded compensating springs are thereby angled against each other in the shape of a parallelogram of forces.

The suspended load (F) acts directly on the mainspring (B) via the load tube (A). The pre-loaded compensating springs (C) act additionally on the load tube as the resulting force (F) via pivoting cams (D) and roller supports (E). The mainspring force (F) and the resulting force (F) change on the shifting of the load over the displacement range in accordance with the specified spring constants, the cam path, and the angular position of the cam components.

The course of the resulting force corresponds to the characteristics of the mainspring. In this way the mainspring force is balanced out, without deviations, to a constant support force.

- **The LISEGA function principle leads to absolute constancy which by theory can easily be proven.**
- **The LISEGA function principle permits an especially wide load adjustment range of 40% – 100% of the nominal load.**

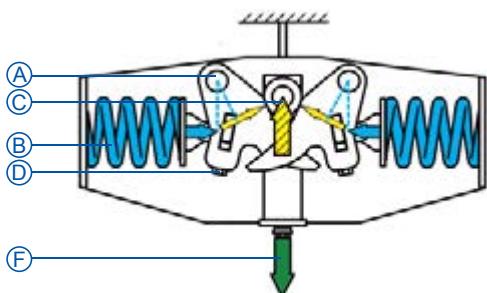

Load adjustment

The load adjustment is carried out by a pre-loading of the mainspring. As the characteristics of the resulting balancing force and the mainspring are the same, only a linear shifting of the initial force thereby occurs (F₁). This way, the change in force is the same at every point of the movement and the ultimate load remains constant at each load setting.

The remaining travel range changes proportionally to the load alterations.

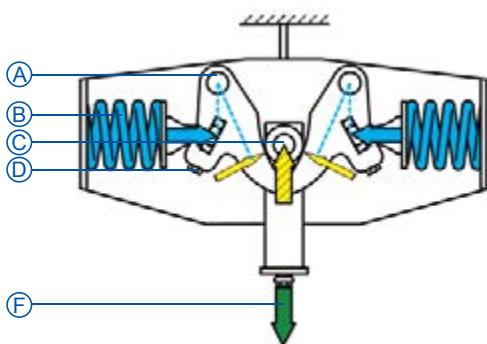

Mode of operation and function

Types 18, 19

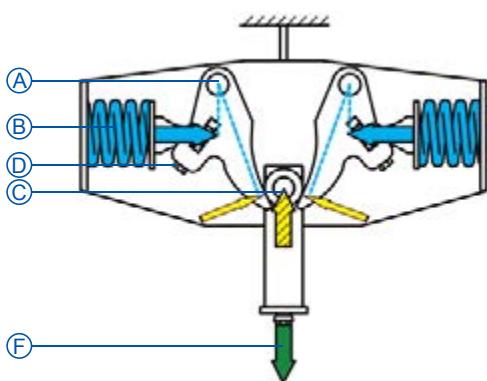

Function principle for LISEGA constant hangers type 18 and constant supports

The function principle is based on the lever principle, by which variable spring forces are transformed into a constant support force by way of lever mechanics.

Two lever arms (A), symmetrically arranged at an angle to each other, thereby act as one system with pre-loaded springs (B). On a vertical change in position of the load (F) to be taken up, the displacement is distributed over rollers (C) and defined bearing surfaces onto the lever systems. Through the pairing arrangement of the levers the displacement runs linearly in the axis of symmetry, whereby the lever conditions that thereby change do so proportionally to the correspondingly changing spring preloading. In this way the load stays in balance with the adjusted load in every travel position.

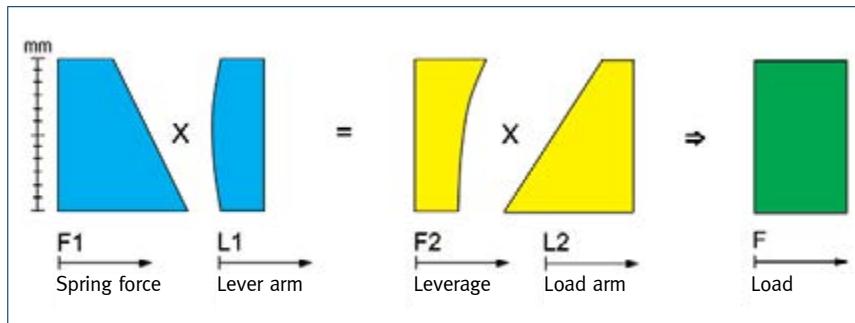

Sinus-shaped load deviations from the lever movement in the form of an arc are balanced by correspondingly machined cam profiles. This way the load distribution is held constant with mathematical accuracy in every position.

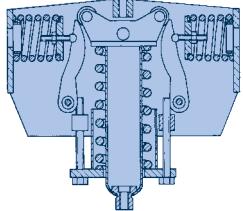

Load adjustment

The calibration load is adjustable within a range of approx. 50% to 100% of the maximum hanger force. By way of an adjusting screw (D) the length of the lever arm force is continuously variable.

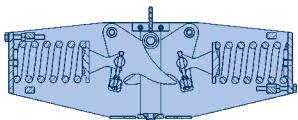

On all load settings the available travel range remains unchanged. The whole working travel range is always available.

Design features

LISEGA constant hanger
type 11 standard design

LISEGA constant hanger
type 18 compact design

Design Structure

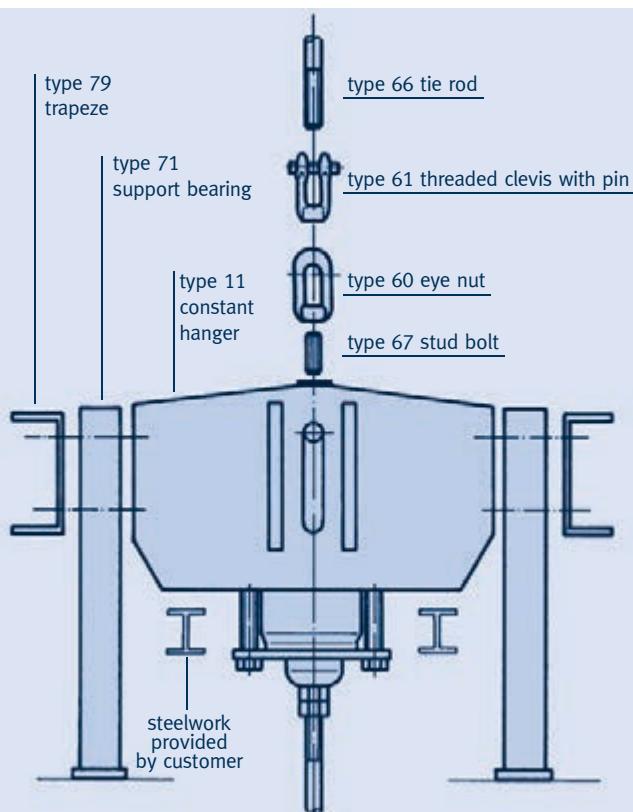

A steel body encases the moving parts such as springs and cam lever. The compact arrangement of the individual components enables small external dimensions. The body is designed to bear loads and is mass-produced for the attachment of standardized connections.

Connection possibilities

The connection threads correspond to the respective LISEGA load group, whereby the upper connection thread (type 11) has a defined engagement depth and the lower one is designed as a load nut for length compensation.

Due to their design, type 11 constant hangers can also be seated directly on suitable connecting components without the need for accessories. In addition, special support brackets can be bolted on using the standard tapped holes provided. Type 11 constant hangers above load group 9 (heavy duty) and type 18 constant hangers are fitted with yoke plates (only on top) for a bolted connection, instead of connection threads.

▼ Serial connection types

Performance range

Constant hangers and supports are produced as standardized single-cell hangers in load groups C to 9. In addition, type 11 constant hangers in sizes 8 and 9 are coupled to form hangers for higher loads (heavy duty). In this way a standard performance range from 0.13kN to 500kN is covered. Constant hangers are manufactured in the seven standard travel ranges 75 / 150 / 300 / 450 / 600 / 750 / 900 mm and constant supports up to 300mm.

Standards and calculations

Component design and layout correspond to the applicable national and international standards and recognized technical specifications with regard to load capacity, function and lifespan. This applies equally to the materials used, the welding technology and other processes. The relevant details are clearly defined in the technical specifications, p. 0.9.

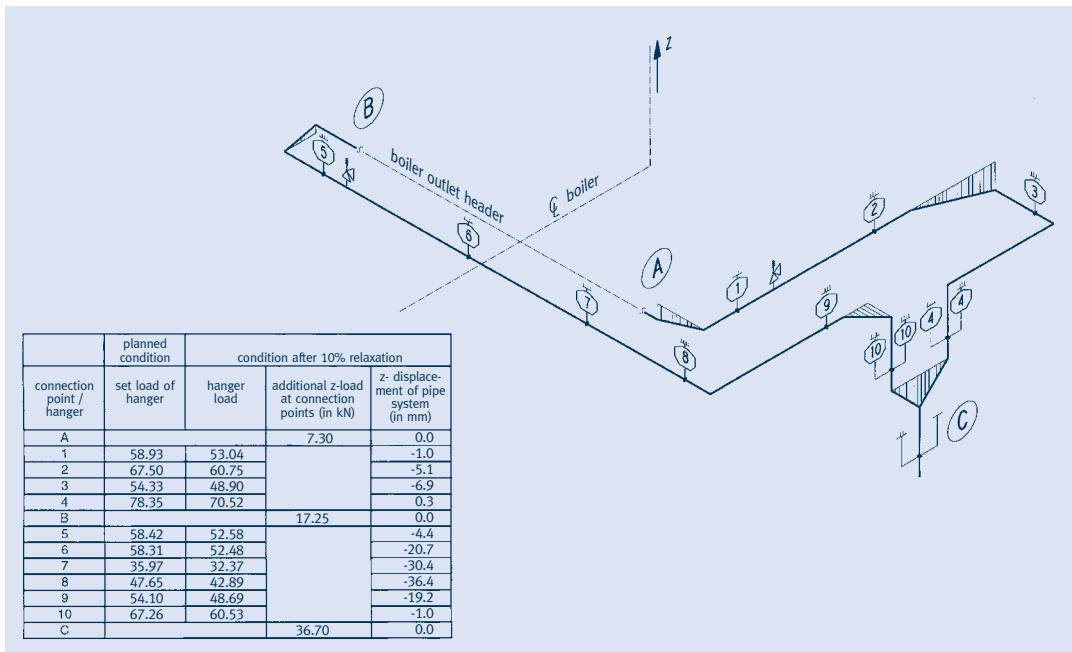

Springs

The springs are crucial components for the smooth functioning of constant hangers and supports – their long-term functional efficiency is vital for the operational safety of hangers and supports. The relevant standards are the basis for the design of LISEGA helical coil springs. Details can be found in the **technical specifications**, section 0.

Spring relaxation

When subjected to loads and temperature over a period of time, conventional helical coil springs lose part of their reset force through relaxation (settling loss). In constant and spring hangers this can, in the long term, lead to a reduction in the set ultimate load of more than 10% (see calculation example).

LISEGA exclusively uses springs that, through an artificial aging process, show no appreciable settling loss. The spring relaxation normally to be expected is anticipated by producing preplastification in a hot setting process with greater coil lengths.

Calculation example of cumulative additional loads due to hanger relaxation

A pipe system was observed ($\text{dia} = 525\text{mm}$, $s = 27\text{mm}$, temperature = 540°C , pressure = 50 bar). The effect of a 10% loss of force in the hangers was assumed. Due to this loss, the pipe system is displaced by 36.4mm.

The maximum primary stresses were calculated in the vicinity of the boiler connection. They stand 93% above the planned stress condition.

The permissible stresses for the boiler connection are exceeded by 9% (calculations acc. to Regulation B31.1).

Corrosion protection

The constant hangers are finished with a LISEGА standard coating which, together with a metallically pure treated surface, offers superior corrosion protection with high mechanical stability. Bearings and bearing bolts for the constant hangers are plated or made of non-rusting materials. All threaded components and cams are electro-galvanized. The surface of the spring is given a special finish (**technical specifications** p. 0.11).

Constant hangers with standard corrosion protection need no maintenance if installed in buildings or in locations protected from the weather. For operation in the open or in special situations, corresponding extra corrosion protection can be arranged – see the corrosion protection section in **technical specifications**, p. 0.10.

Paintshop

Spring testing at material reception

Function testing

Functional performance

The special functional principle of LISEGA constant hangers guarantees constancy across the entire travel range. This is also unaffected by shifts in load. Only a minor adjustment force produced by tolerances and bearing friction is to be taken into account. The hysteresis so produced is kept within strict limits due to the design principle and modern production processes.

In effect, the deviation in the set load of LISEGA constant hangers on the serial average can, on normal load setting, be kept to $\pm 3\%$.

Applying a selection process, with limited load and travel ranges, it is possible to reduce this even further.

The typical permissible deviations are set out in the following international codes:

- **MSS SP-58 (USA), max. $\pm 6\%$ in relation to the operating load**
- **VGB-R510L and KTA 3205.3, Germany, max. $\pm 5\%$ in relation to the operating load. The deviation in load adjustment (medium load) is limited to $\pm 2\%$**
- **DIN EN 13480-T3 max. $\pm 5\%$ in relation to the operating load**

Function testing

Before shipment, all constant hangers and supports are tested for flawless functioning and set to the load ordered. The test results are recorded.

The calibration values are stamped onto a riveted name plate. The calibration load is also marked permanently on the load scale. Hot and cold positions are noted on the travel scale in red and white respectively.

The respective travel positions can be read directly off the travel scale in mm or inches.

Calibration and testing of type 12

Acceptance testing of a constant hanger

The calibration load in each case can be read directly off a load scale in kN or lbs. For the functional tests, test benches operating quasi-statically with capacities up to 1,000 kN are on hand. The test benches are checked regularly by an independent supervisory body.

Example of a test certificate in a standard delivery inspection

Testing a constant hanger on a LISEGA 120kN test bench

Mobile LISEGA 50kN snubber test bench PR50

LISEGA testing technology is constantly under improvement and represents state-of-the-art technology. These improvements cover test benches for constant hangers and supports, spring hangers and supports, as well as snubbers.

The testing facilities are in operation at all production sites within the LISEGA group, while mobile units are available for use at customer locations.

32 test benches are on hand for constant and spring hangers or constant and spring supports in the load range from 1kN to 1000kN. All LISEGA test benches are tested at regular intervals according to DIN EN ISO 7500 with calibrated load cells and measurement amplifiers.

All components are tested in installation condition and adjustment.

Testing a spring hanger on a LISEGA 120kN test bench

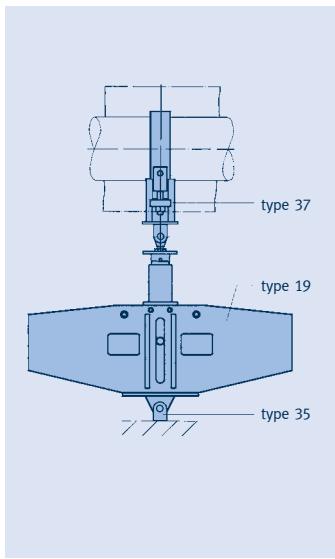

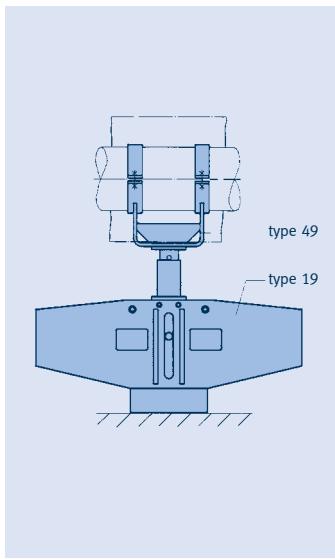

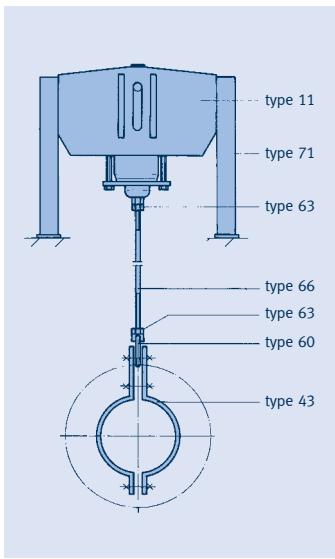

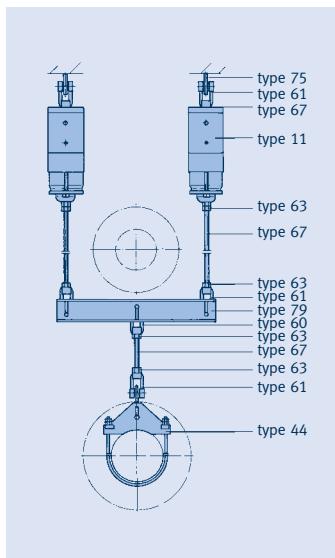

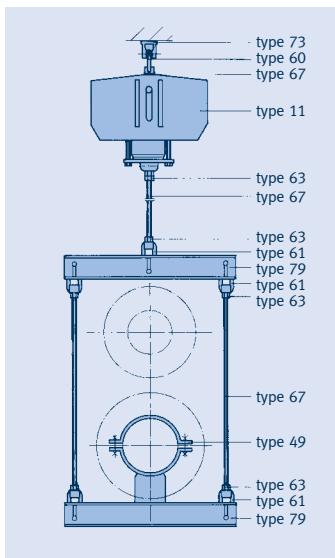

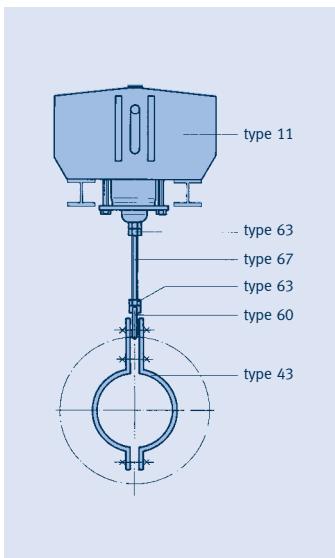

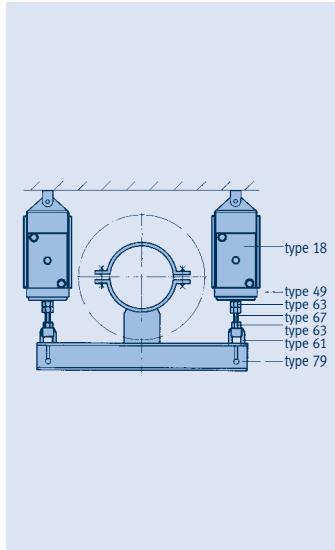

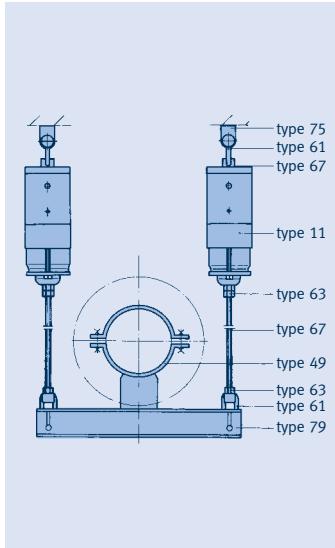

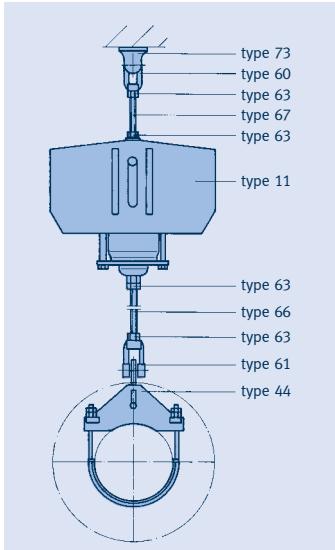

Installation overview

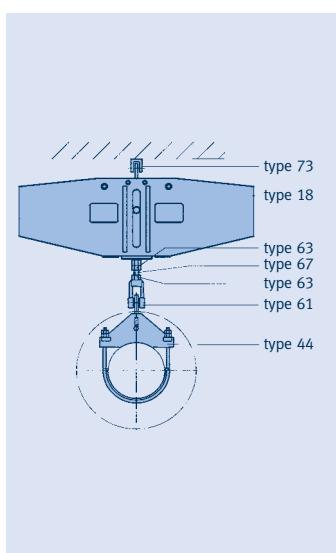

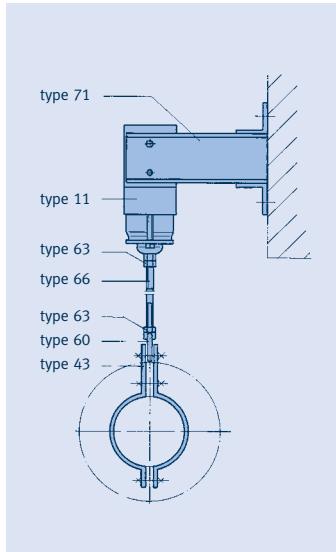

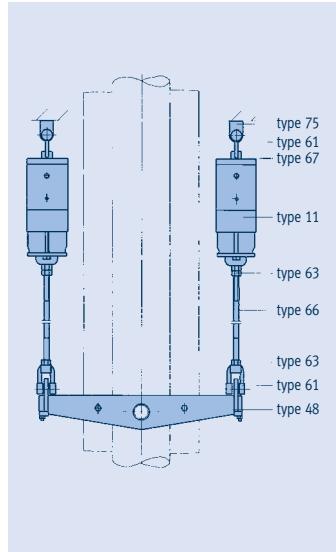

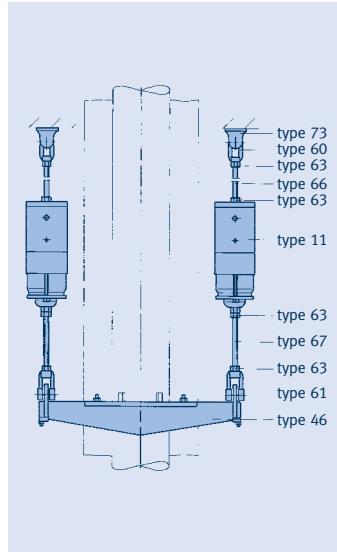

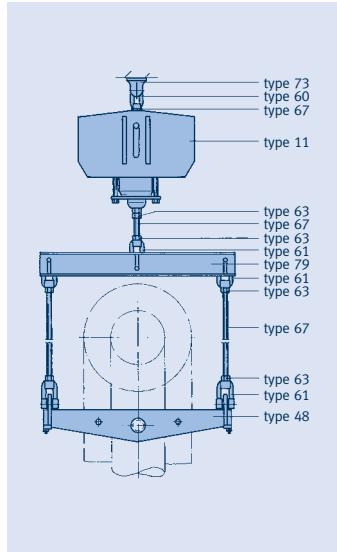

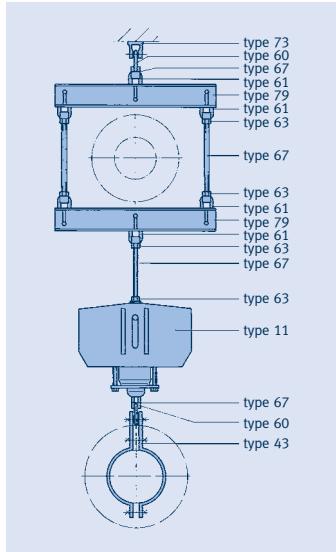

Universal adaption to existing installation spaces

The installation of the constant hangers can be adapted to any situation in the plant through the use of universal accessory components from the modular system.

Automatic designing

All configurations can be created in just a few steps via the LICAD design software in the shortest of time with the input of 6 parameters – with parts lists and drawings.

Constant hangers

Type 11

Constant hangers

type 11 C3 19 to 11 96 15

Serialized standard design,
delivery from stock.

① Dimension E for upper blocking position, in other blocking positions dimension E lengthens accordingly.

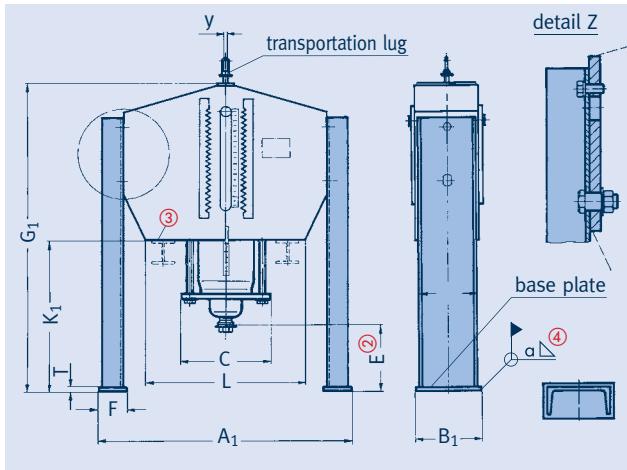

② X = minimum engagement depth. At the lower connection, maximum engagement depth = X + 300mm.

① The 5th digit in the type designation denotes the design:
6 for support brackets,
bolted, standard design,
8 for support brackets,
bolted, for increased
requirements.

② Dimension E for upper blocking position, in other positions E changes accordingly.

③ The constant hangers can in principle be directly seated and welded to the structure. Care must be taken to allow access to adjusting screws and lock nuts. If this is not possible, supports type 71 are appropriate.

④ Minimum weld seam.
Longer support brackets are available on request.

Support brackets Type 71 for constant hangers Type 12-14

**Support brackets for
constant hangers
type 12-14
type 71 82 .2 to 71 96 .4**
Standard design,
delivery from stock.

① The 5th digit in the type designation denotes the design:
6 for support brackets,
bolted, standard design,
8 for support brackets,
bolted, for increased requirements.

② Dimensions E and G2 apply to upper blocking position,
in other blocking positions E and G2 change accordingly.

③ Minimum weld size.

Other lengths are also available on request.

Constant hangers

Type 18

Constant hangers

type 18 D3 17 to 18 93 17

Standard design,
delivery from stock.

① Dimension E in blocking position right at top – in other blocking positions E lengthens accordingly.

② X = minimum engagement depth. At lower connection max. engagement depth = X + 150mm.

Max. permissible stresses:

- Emergency (HZ) at 80°C = Calibration load x 1.33
- Faulted condition (HS) at 150°C = Calibration load x 1.66

* friction value of the slide plates see table p. 7.11

Max. permissible stresses:

- Emergency (HZ) at 80°C = calibration load x 1.33
- Faulted condition (HS) at 150°C = calibration load x 1.66.
- Max. blocking load at 80°C = calibration load x 1.5.

Order details: constant support type 19 ... , marking: ..., calibration load: ...kN, travel: ...mm up/down, blocking position (as required): ...mm

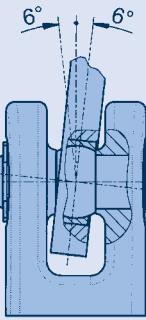

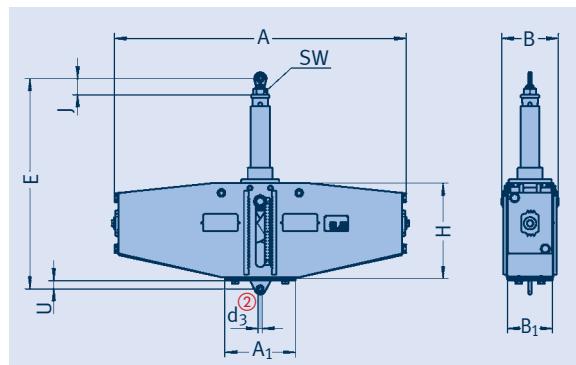

Angulating constant supports

Type 19

Angulating constant supports type 19 D3 37 to 19 93 37

Standard design,
delivery from stock.

For large horizontal dis-
placements in the pipe
systems the constant
supports can be fitted
with ball bushing joints.

The ball bushing joints for the connection are designed to fit weld-on bracket type 35.

① Dimension E on blocking position right at top, in other blocking positions E shortens accordingly and allows adjustment of +200mm.

② Connection possibilities:
See bolt diameter of weld-on brackets type 35 or dynamic clamps (Product Group 3).

Max. permissible stresses:

- Emergency (HZ) at 80°C = Calibration load x 1.33
- Faulted condition (HS) at 150°C = Calibration load x 1.66
- Max. blocking load at 80°C = Calibration load x 1.5.

Constant hanger trapezes

Type 79

Constant hanger trapezes types 79 D2 15 to 79 96 15

This design of trapeze is used if the standard design type 79 .2 34 does not fit due to extremely restricted installation space. The trapezes are supplied bolted ex works.

(1) X = min. engagement depth
+ 300mm engagement possibility.

(2) Dimension L and dimension Z are to be stated when ordering.

(3) Dimension E and dimension C 0mm in blocking position, in other blocking positions E and C lengthen accordingly.

(4) When selecting the constant hanger trapeze its total weight and the clamp base weight must be added to the operating load.

(5) The L_{max} dimensions can be lengthened to 2400mm on load reduction by 5% per 100mm extension.

① Dimension E in blocking position right at top – in other blocking positions E shortens accordingly and allows for adjustment of +60mm.

② Dimension E for constant supports according to E ①, which are additionally fitted with a slide plate (friction value of the slide plates see p. 7.11).

③ Type 16 is supplied with a corrosion-protected load plate as standard. When using a slide plate up to 180°C operating temperature, the type number in the 6th digit is to be replaced by a 7 (e.g. 16 82 27), or up to 350°C by a 6 (e.g. 16 82 26).

Servohangers

Type 17

Under certain conditions, pipe systems or other components are restricted in their thermal displacement through friction or other influences, despite the use of spring and constant hangers or constant supports. In such cases servohangers can actively overcome the restriction.

Application

In standard cases, the weight of the pipe systems is practically in equilibrium with the calibration load of the constant hangers and constant supports. The sum of the deviations occurring and the additional stresses in the piping due to this then remain within the permissible harmless range.

In certain cases, the sum of the deviations occurring can also exceed a permissible level and considerably reduce the life of the piping systems or their connections (in the creep strength range) in the form of additional secondary stresses.

Deviations can arise through:

- **wall thickness tolerances of the piping, if these are not weighed extra and the weight differences taken into account**
- **insulation weights not determinable in advance**
- **mechanical friction and production tolerances for constant hangers (permissible $+/- 5\%$)**
- **spring relaxation**

- **pipe statics that are not always readily determinable**
- **practical deviations from the theoretically planned load distribution**

A combination of deviations can cumulatively reach significant levels. These deviations have a particularly negative effect in flexible, 'soft' pipe systems. Vertical expansion can be obstructed or even completely suppressed here, even with relatively slight individual deviations.

Apart from the additional loads caused, impermissible sagging can result, due to spring hysteresis in the pressure-stressed system, with a reversed incline. In addition to possible creep rupture, in the event of an incorrectly positioned incline, dangerous water hammer can occur.

In such cases it would be advisable to supplement the passively reacting constant hangers with the active LISEGA servohangers.

Typical cases of application for LISEGA servohangers

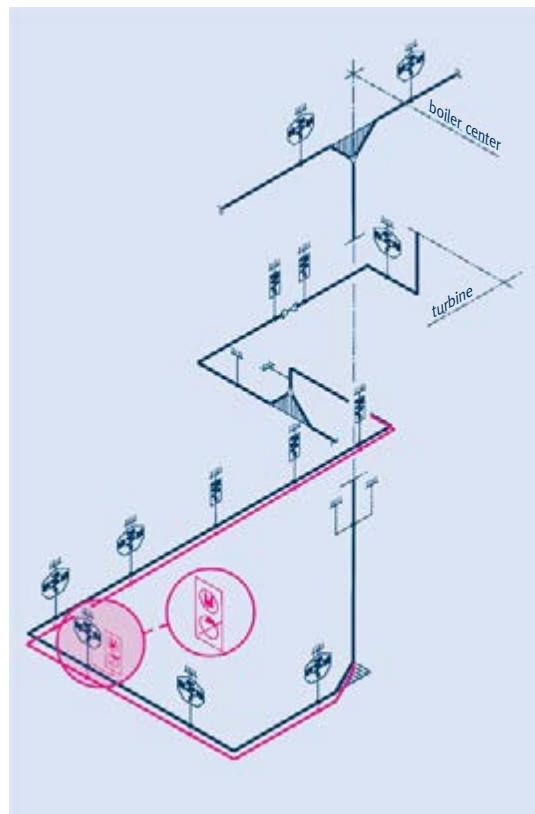

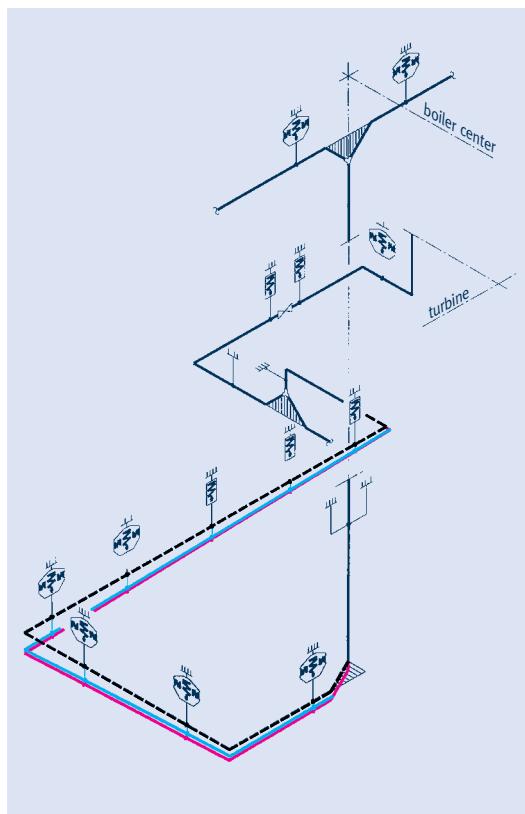

original cold position

hot position

new cold position

without servohangers (diagram on left) the pipe system remains in the hot position

with servohangers (diagram on right) the pipe system shifts to its specified positions

Through use of the hydraulic servo support the pipe system can now be repositioned to the specified elevation.

Design and mode of operation

The type 11 constant hanger forms the basis for the servohanger. To overcome load differences it is additionally fitted with an auxiliary hydraulic device that can exert an active supplementary force in both directions (servo support).

In standard cases, the temperature of the pipe system to be supported is used as a control parameter. The temperature in each case is transformed electronically into the corresponding travel position. In the theoretical / actual comparison procedure, the control ensures a regulated approach to the actual vertical elevation position.

Electrohydraulic control

The hydraulic unit and the control are located separately from each other in a separate switch cabinet situated near the servohanger (max. distance 16m).

The hydraulic pistons for control of the movement are located in the load tube of the constant hanger.

Safety switch

The electrohydraulic control is so designed that in the event of an operational breakdown (e.g. power loss) only the servo support is lost, but the unit will continue to function effectively as a constant hanger.

For theoretical (temp.) / actual (travel) deviations a tolerance range can be set. If the deviation is outside these values, the control switches off automatically.

Manual switch-off

For any maintenance work required on the system or the boiler, the servo support can be switched on or off manually.

Design sizes

Load Groups 5 (F_N 20kN) to 9 (F_N 100kN) with travel ranges 2 (150mm) and 3 (300mm) are considered standard. For other cases, special designs can be supplied.

Operating instructions

Installation and commissioning instructions, as well as servicing recommendations, are included in the scope of supply.

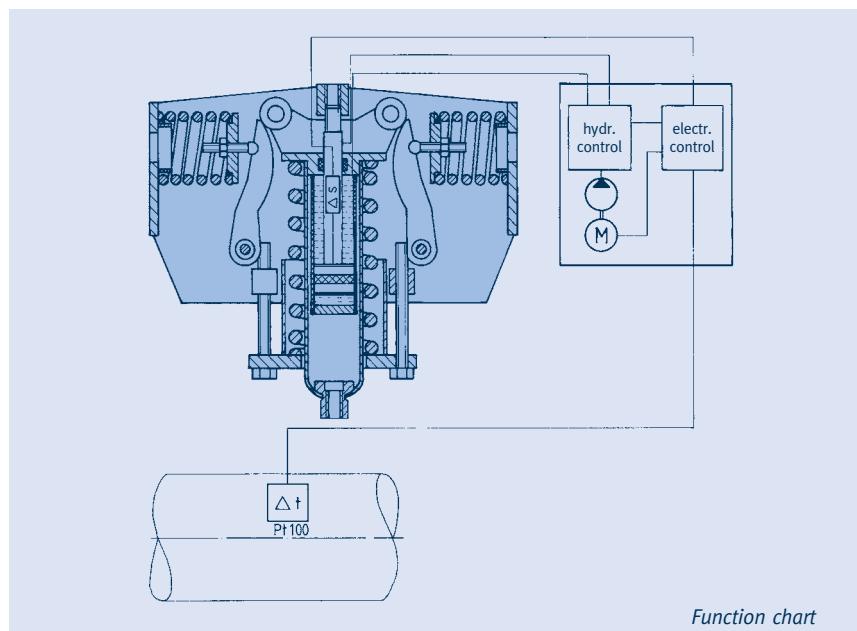

Servohanger switch cabinet

(installation condition) and blocked. The adjustment values can be read off the load and travel scale as well as the name plate.

Low profile constant hanger type 18

Constant support type 19

Angulating constant support type 19

Stamped on the plate are:

- type
- serial number
- LISEGA order number
- calibration load
- inspector
- travel
- ident. number

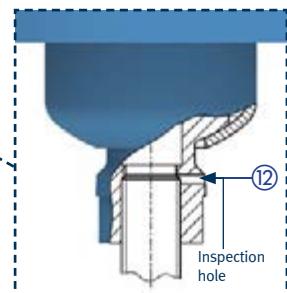

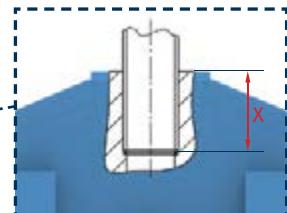

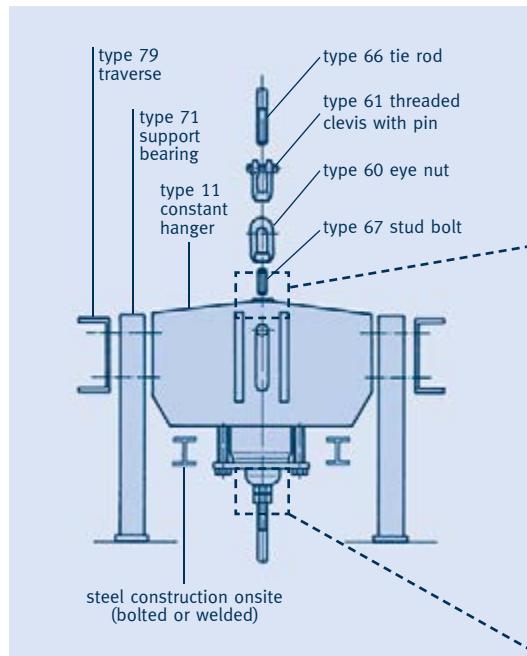

Connections type 11 C3 .. - 11 96 .. (single cell hangers)

The upper connection is designed as an inner thread with limited engagement depth. The lower connection is designed as a spherical lock nut pivotable in all directions by min. 4°. The connection threads are greased and sealed with plastic caps.

When connecting to the connecting rods, care must be taken that the lower rod is screwed into the lock nut **at least to the inspection hole**. A further engagement depth of at least 300mm is available.

Connections type 12 82 ..- 14 96 .. (heavy duty)

The upper connection is designed as a yoke plate. The lower connection is also designed as a yoke plate and fastened to the spherical lock nuts of the individual constant hanger cells, whereby pivoting of min. 4° is possible. The connection threads are greased and sealed with plastic caps.

Min. engagement depth of connection rod in load tube

Constant hanger type 11 (seated)

These constant hangers for all load sizes can be directly seated. They can also be supplied with serial support brackets type 71 which, depending on the order specifications, can be connected and bolted via precision-fit boreholes at works or on site. The base plates of the support brackets can be welded to the contact surface. On request, support brackets with slot holes for bolting can be supplied.

Connections type 18

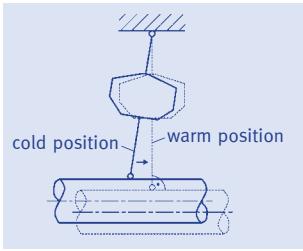

The upper connection is designed as a yoke plate and the lower one as a spherical lock nut, pivotable in all directions by min. 4°. The connection threads are greased and sealed with plastic caps.

Connections type 19

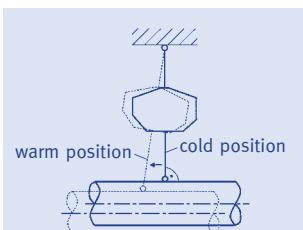

The upper connections of the constant supports are fitted either with a load plate or slide plate to reduce friction from lateral displacement, or with a ball-joint lug for angulating constant supports. The lower connections are therefore either a pedestal or a lug. During welding work at the pedestal the components inside constant supports must be protected.

Transport lock type 12 82 .. – 14 96 .. (heavy duty)

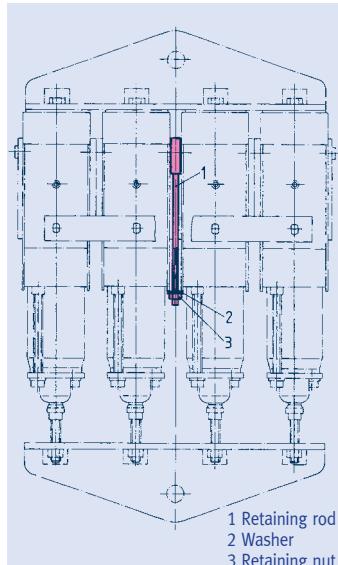

Coupled constant hangers are supplied with a transport locking device (retaining rod, washer, retaining nut).

Rods vertical during plant operation

Rods vertical in installation condition

Transport lock
type 12 82 .. – 14 96 ..

The transport lock is loosened only on completion of hanger installation and at the same time as the removal of the blocking plates.

For this, the retaining nut marked in red is removed at the lower end with a socket wrench. Both parts (retaining rod and nut) are to be stored in the same place as the stops. When making the force-fit connection, care must be taken that the lower yoke plate is screwed into the lock nuts at least up to the inspection hole. The installation dimension of the lower yoke plate can be lengthened with the lock nuts by 250mm or shortened by 70mm.

3 Installation of the constant hangers

When installing, the specifications of the **installation instructions for pipe systems** must be followed. Special attention must thereby be paid to the desired installation position of the suspension rods throughout the whole support chain. There are two possibilities here:

A) The connecting rods are to be installed at an angle according to the expected horizontal displacement in the pipe system. A perpendicular position is hereby anticipated in operating condition.

B) The connecting rods are to be installed vertically for the purpose of better inspection. A controlled angled position in operating condition is thereby permitted.

At all events, uniform specifications for the whole installation should exist.

The connecting rods and points are to be force-fitted.

Type 11 C3 .. – 11 96 .. (single cell hanger)

For installation of the constant hangers, transport lugs or other assembly devices can be screwed into the threaded holes on the sides. After deblocking of the hanger (see point 4) the stops are to be screwed on here for safe keeping. For constant hangers with support brackets type 71 the hangers are fitted with transport lugs instead of the upper connection – these can also store the stops.

Constant hangers

types 12 82 .. – 14 96 ..

For installation of the hangers, the side openings of the upper yoke plate can be used for hooking on. For hangers with support brackets, the upper yoke plate is replaced by a transport lug.

4 Deblocking

Requirements

The correct deblocking of the constant hangers in accordance with the following instructions is crucial for the subsequent faultless functioning of the pipe systems.

The stops are to be removed, as far as possible, immediately before commissioning.

The stops must be removed as a matter of principle in a systematic way, one after the other, beginning at a fixed point or connection point.

The whole system should be inspected beforehand according to point 3 of these installation instructions.

Actual and theoretical condition

When it has been ensured that all connections are firmly force-fitted, the suspended weight is completely taken up by the constant hangers or supports.

If the weight load agrees with the calibration load and the piping system shows no sign of stress, then the planned equilibrium has been achieved. The blocking plates can be easily removed.

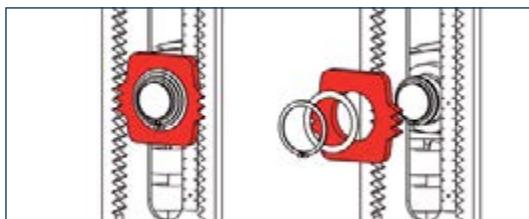

In practice however, slight stresses in the piping systems and hence resulting load shifting can hardly be avoided.

In the same way, the loads, which are usually determined theoretically, can show larger tolerances. As a result, the deviations can lead (according to under- or over-load) to corresponding jamming of the blocking bolt in the lower or upper section of the blocking plate.

Procedure

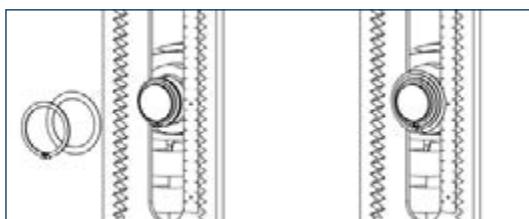

The blocking devices are removed when the guide bolt is free. The calibration load is made up of the old load and the extra weight of the hanger components suspended. If the guide bolt is lying at the top or the bottom, the load adjustment must be adapted before deblocking (see point 5, load correction):

When removing the stops, care must be taken that only the outer lock ring is loosened.

Blocked condition

① Dismantling of the outer lock ring and blocking device

② Assembly of the outer lock ring

③ Completed: deblocked condition

In cases of requirement, e.g. for revisions, the hangers or supports can be blocked again in any position. For this, the stops are placed on the guide bolts and secured. The devices are firmly screwed to the side of the constant hanger body in types 11 to 14.

Load distribution

Under no circumstances should the stops be removed by force!

By loosening or tightening the connecting rods with a few turns of the lock nut in the case of constant hangers, or corresponding adjustment of the support tube for constant supports, stresses in the pipe system can be compensated for and the guide bolt is then free.

The geometrical position of the pipe system must not be altered when balancing stresses!

As later adjustment at one point can cause a renewed slight shift at another, the procedure must be repeated if necessary at different points. For clear control it is recommended that, as a matter of principle, the stops should only be removed when all the guide bolts are free.

5 Load correction type 11, 12-14

Load correction is necessary if the calibration load (set at the LISEGA facility) deviates from the weight actually applied. In this case, with LISEGA hangers the calibration load can also be adjusted in the installed condition.

It should thereby be taken into account that for load increases the remaining travel is shorter. In most cases this is not critical, due to the travel and load reserves available. For safety reasons this should be checked with the catalog data. Any changes in the installation dimension caused by load corrections must be compensated for within the load chain.

Procedure:

- 1) Loosen of both load adjustment screws.

a) Bolt is free:

Calibration load of the constant hangers agrees with the weight applied. Blocking plate can be removed.

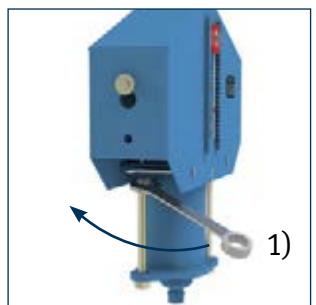

b) Bolt lies at bottom:

Calibration load of constant hanger is smaller than weight applied. Loosen connecting rod or increase calibration load.

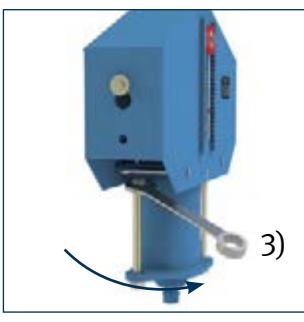

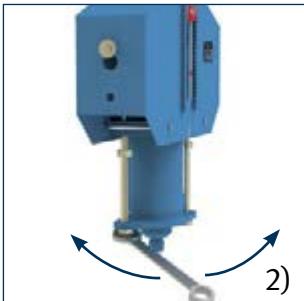

c) Bolt lies on top:

Calibration load of constant hanger is larger than weight applied. Tighten connecting rod or decrease calibration load.

1)

- 2) Screw in or screw out alternately the two load adjustment screws, by a turn in each case. The base plate of the load tube and the lower edge of the constant hanger body must thereby remain parallel.

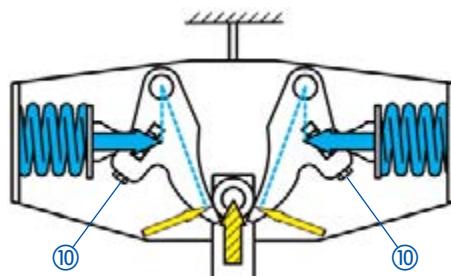

The procedure is completed as soon as the guide bolt no longer lies at the top or the bottom of the stop. If, for constant hangers of higher load groups, the necessary adjustment forces are too big and manual adjustment is not possible, auxiliary devices must be used (see point 6, auxiliary devices).

- 3) Tighten the lock nuts of the load adjustment screws. Now deblocking can continue.

Load correction types 18, 19

By way of the adjusting screws ⑩ the length of the lever of the leverage arm is altered on the left and right respectively.

On load adjustment the working travel remains unaltered.

Procedure:

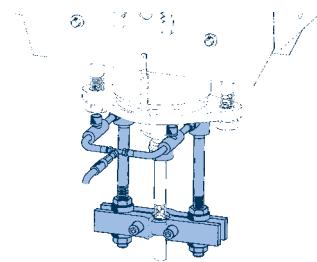

Blocking device bolted to front side

- 1) Unlock tab washer.
- 2) Turn adjusting screws equally on both sides until the guide bolt is free.
- 3) Secure adjusting screws against twisting by locking the tab washers.

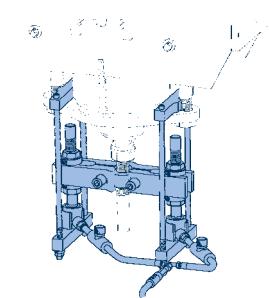

6 Auxiliary devices

Tightening or loosening of the connecting rods, as well as load calibration, can be performed manually on all hangers. For hangers in the higher load groups this work can require a great deal of effort due to the higher load calibration.

To facilitate the work, an auxiliary device can be made available with which a hydraulic load take-up using a handpump can be effected. It is operated by LISEGА personnel.

Installation device, used to relieve the adjustment screws

Installation device, used to relieve the blocking

7 Inspection and maintenance

The flawless functioning of the constant hangers and supports can be checked in every operating situation by examining the position of the guide bolt.

Under normal operating conditions, maintenance is not required.
